

## **SINGULARITY and Heavy Metal Grinders**

“Singularity” is the energetic substance of all existence; its two modes of originality are precursors to sexuality, electromagnetism and self-reflective consciousness. At the axes of swirling galaxies are small numbers of orbiting heavy metal suns whose gravity sucks everything in proximity into its hopper (event horizon) and grinds everything into the “flour of singularity,” what is the first and original stuff of Eucharist

From my personal interest in and reading about cosmic science (I make no claim to scientific professionalism—I’m just an interested observer) I understand there are two kinds of cosmic singularity; the super-concentrated density that seeded the big bang and the ultra-high frequency wave bands (electromagnetism) that are the axle channeling energy (gamma rays, x-rays, etc) into the cosmos. This latter singularity is called “naked singularity” because it is invisible in the same way that “dark matter”, the great bulk of substance in the universe, is invisible.

The early Eastern Christian theologian, St John of Damascus, defined God as “a sea of infinite substance.” Creation’s life potential arises from the joining of the two modes of singularity, which are precursors to atomic nuclei/ electrons, femininity/ masculinity, the ovum and the sperm. The “sea of infinite substance” (invisible singularity) is the amniotic matrix containing potentials of life’s diversification, its function and endurance. The seeding of the amniotic matrix (invisible positive potential), by the gravity potential of negative energy (the big bang point-density), initiates the pregnant evolution of the cosmos and life processing up to the present time and on into the unknowable future.

Recently (August 2009) a television program on IPTV (Monster of the Milky Way) was aired; it was about black holes, the grinding mills at the center of galaxies. The untold numbers of cosmic galaxies are giant pinwheels. From their centripetal centers (black holes) to their centrifugal peripheries they are held together by the balancing of electrical forces which also give the galaxies their great potentials for diversification and ultimately the creation and sustaining of life.
